

Exercise #1 – Grids

The following exercise contains the following subjects:

- HTML
- CSS

Question

As you know, every row has 12 boxes with the website's width, a column can take from 1 to 12 slots of width, and all within the same row cannot add up to more than 12 slots.

With Bootstrap 5, you simply have to add the `.col` class and it will automatically distribute the columns evenly throughout the 12 slots within the row.

1. Make the second row to have 3 columns of the same width (split the row in 3).
2. Add a third row with only one column of 12 slots.
3. Change the background color of this last row to red.
4. Change the main **container** to **container-fluid**.

Let's test the grid baby!

First col

Second col

Third col

Forth col

Forth col
